

# Commodity Trade and the Carry Trade: A Tale of Two Countries

---

Discussion by Ric Colacito

THE UNIVERSITY  
*of* NORTH CAROLINA  
*at* CHAPEL HILL

---

# Summary of the paper and Roadmap

- **Motivation**

- persistent differences in interest rates across countries
- account for much of the profitability of currency carry trade
- what is the economic explanation?

# Summary of the paper and Roadmap

- **Motivation**

- persistent differences in interest rates across countries
- account for much of the profitability of currency carry trade
- what is the economic explanation?

- Study an economy with:

- two heterogenous countries
  - 1 exports commodities and imports final goods (Australia)
  - 2 imports commodities and exports final goods (Japan)

# Summary of the paper and Roadmap

- **Motivation**

- persistent differences in interest rates across countries
- account for much of the profitability of currency carry trade
- what is the economic explanation?

- Study an economy with:

- two heterogenous countries
  - ① exports commodities and imports final goods (Australia)
  - ② imports commodities and exports final goods (Japan)
- shipping costs

# Summary of the paper and Roadmap

## ● Motivation

- persistent differences in interest rates across countries
- account for much of the profitability of currency carry trade
- what is the economic explanation?

## ● Study an economy with:

- two heterogenous countries
  - 1 exports commodities and imports final goods (Australia)
  - 2 imports commodities and exports final goods (Japan)
- shipping costs

## ● The authors find that

- “non-commodity” currencies must absorb global shocks
  - they are riskier
  - they have lower interest rates (on average)

# Summary of the paper and Roadmap

## ● Motivation

- persistent differences in interest rates across countries
- account for much of the profitability of currency carry trade
- what is the economic explanation?

## ● Study an economy with:

- two heterogenous countries
  - 1 exports commodities and imports final goods (Australia)
  - 2 imports commodities and exports final goods (Japan)
- shipping costs

## ● The authors find that

- “non-commodity” currencies must absorb global shocks
  - they are riskier
  - they have lower interest rates (on average)
- empirical evidence of currency risk premium for “commodity” currencies

# Summary of the paper and Roadmap

## ● Motivation

- persistent differences in interest rates across countries
- account for much of the profitability of currency carry trade
- what is the economic explanation?

## ● Study an economy with:

  - they are riskier
  - they have lower interest rates (on average)
- empirical evidence of currency risk premium for “commodity” currencies

## ● Comments:

- what does Australian trade look like?
- what if we make this “a tale of **three** countries”?

# Australian Trade at a Glance

Source: Australian Government, Department of Foreign Affairs and Trade

# Australia and Japan

Source: Australian Government, Department of Foreign Affairs and Trade

# Australia and US

Source: Australian Government, Department of Foreign Affairs and Trade

# Take-aways

- Australia is net exporter of commodities
- Imports final goods and services from
  - US (primarily)
  - Japan
  - (not including China...)

# Take-aways

- Australia is net exporter of commodities
- Imports final goods and services from
  - US (primarily)
  - Japan
  - (not including China...)
- What happens if we extend the baseline model to include the US?

# The Model

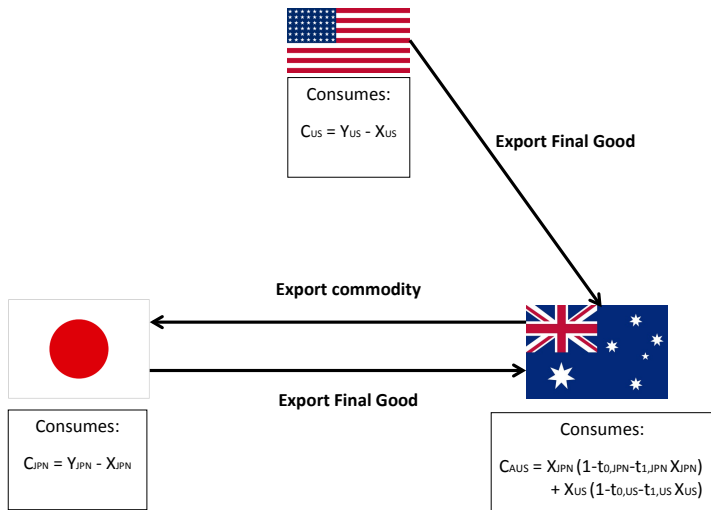

# The Model

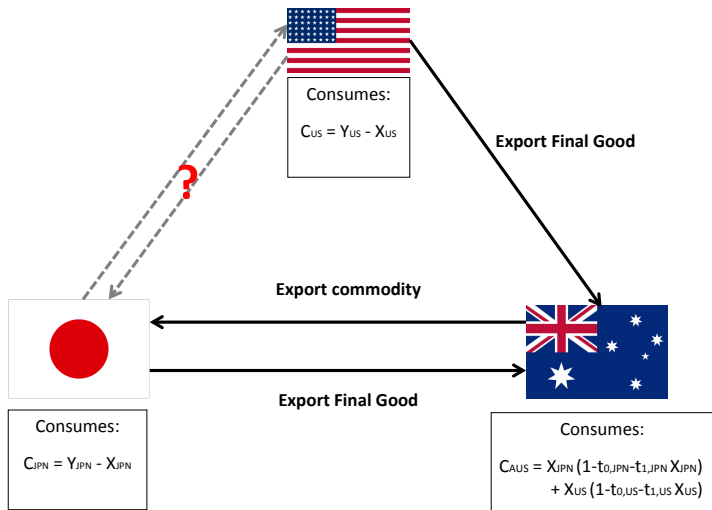

# The Model

# The Model

## Planner's problem

Choose  $\{X_{JPN}\}$  and  $\{X_{US}\}$  to maximize

$$E_0 \left[ \sum_{t=0}^{\infty} \beta^t \left( \frac{C_{AUS,t}^{1-\gamma}}{1-\gamma} + \lambda_{JPN} \frac{C_{JPN,t}^{1-\gamma}}{1-\gamma} + \lambda_{US} \frac{C_{US,t}^{1-\gamma}}{1-\gamma} \right) \right]$$

where

$$C_{AUS,t} = X_{JPN,t} (1 - \tau_{0,JPN} - \tau_{1,JPN} X_{JPN,t}) + X_{US,t} (1 - \tau_{0,US} - \tau_{1,US} X_{US,t})$$

$$C_{JPN,t} = Y_{JPN,t} - X_{JPN,t}$$

$$C_{US,t} = Y_{US,t} - X_{US,t}$$

# Calibration

- Four equally likely states

# Calibration

- Four equally likely states
- Two countries

	<b>State 1</b>	<b>State 2</b>	<b>State 3</b>	<b>State 4</b>
$Y_{JPN}$	$Y_{Hi}$	$Y_{Lo}$	$\frac{Y_{Hi}+Y_{Lo}}{2} + 2\epsilon$	$\frac{Y_{Hi}+Y_{Lo}}{2} - 2\epsilon$

# Calibration

- Four equally likely states
- Two countries

	State 1	State 2	State 3	State 4
$Y_{JPN}$	$Y_{Hi}$	$Y_{Lo}$	$\frac{Y_{Hi} + Y_{Lo}}{2} + 2\varepsilon$	$\frac{Y_{Hi} + Y_{Lo}}{2} - 2\varepsilon$

- **Three** countries

$Y_{JPN}$	$Y_{Hi}/2 + \varepsilon$	$Y_{Lo}/2 - \varepsilon$	$Y_{Hi}/2 + \varepsilon$	$Y_{Lo}/2 - \varepsilon$
$Y_{US}$	$Y_{Hi}/2 - \varepsilon$	$Y_{Lo}/2 + \varepsilon$	$Y_{Lo}/2 + \varepsilon$	$Y_{Hi}/2 - \varepsilon$

# Calibration

- Four equally likely states
- Two countries

	State 1	State 2	State 3	State 4
$Y_{JPN}$	$Y_{Hi}$	$Y_{Lo}$	$\frac{Y_{Hi}+Y_{Lo}}{2} + 2\epsilon$	$\frac{Y_{Hi}+Y_{Lo}}{2} - 2\epsilon$

- **Three** countries

$Y_{JPN}$	$Y_{Hi}/2 + \epsilon$	$Y_{Lo}/2 - \epsilon$	$Y_{Hi}/2 + \epsilon$	$Y_{Lo}/2 - \epsilon$
$Y_{US}$	$Y_{Hi}/2 - \epsilon$	$Y_{Lo}/2 + \epsilon$	$Y_{Lo}/2 + \epsilon$	$Y_{Hi}/2 - \epsilon$

→ For each state, the total world output is unchanged.

# Calibration

- Four equally likely states
- Two countries

	State 1	State 2	State 3	State 4
$Y_{JPN}$	$Y_{Hi}$	$Y_{Lo}$	$\frac{Y_{Hi}+Y_{Lo}}{2} + 2\epsilon$	$\frac{Y_{Hi}+Y_{Lo}}{2} - 2\epsilon$

- **Three** countries

$Y_{JPN}$	$Y_{Hi}/2 + \epsilon$	$Y_{Lo}/2 - \epsilon$	$Y_{Hi}/2 + \epsilon$	$Y_{Lo}/2 - \epsilon$
$Y_{US}$	$Y_{Hi}/2 - \epsilon$	$Y_{Lo}/2 + \epsilon$	$Y_{Lo}/2 + \epsilon$	$Y_{Hi}/2 - \epsilon$

→ For each state, the total world output is unchanged.

→ Same mean, but Japan has more volatility.

# Calibration

- Four equally likely states
- Two countries

	State 1	State 2	State 3	State 4
$Y_{JPN}$	$Y_{Hi}$	$Y_{Lo}$	$\frac{Y_{Hi}+Y_{Lo}}{2} + 2\epsilon$	$\frac{Y_{Hi}+Y_{Lo}}{2} - 2\epsilon$

- **Three** countries

$Y_{JPN}$	$Y_{Hi}/2 + \epsilon$	$Y_{Lo}/2 - \epsilon$	$Y_{Hi}/2 + \epsilon$	$Y_{Lo}/2 - \epsilon$
$Y_{US}$	$Y_{Hi}/2 - \epsilon$	$Y_{Lo}/2 + \epsilon$	$Y_{Lo}/2 + \epsilon$	$Y_{Hi}/2 - \epsilon$

→ For each state, the total world output is unchanged.

→ Same mean, but Japan has more volatility.

- For simplicity,  $\tau_{0,JPN} = \tau_{0,US} = 0$ .

# Calibration

- Four equally likely states
- Two countries

	State 1	State 2	State 3	State 4
$Y_{JPN}$	$Y_{Hi}$	$Y_{Lo}$	$\frac{Y_{Hi}+Y_{Lo}}{2} + 2\epsilon$	$\frac{Y_{Hi}+Y_{Lo}}{2} - 2\epsilon$

- **Three** countries

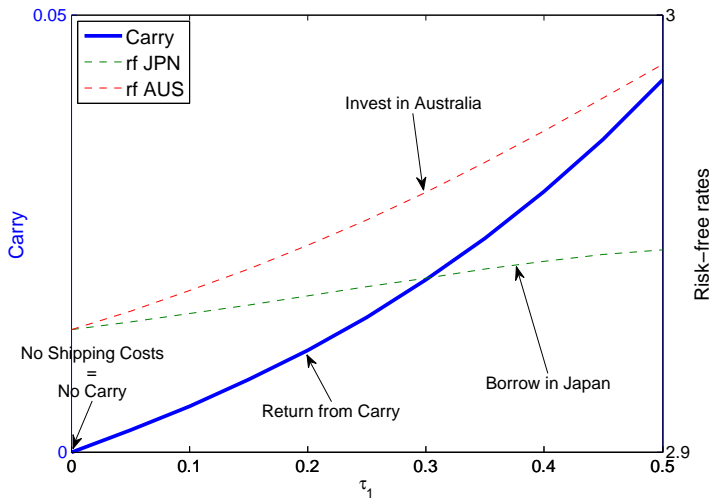

$Y_{JPN}$	$Y_{Hi}/2 + \epsilon$	$Y_{Lo}/2 - \epsilon$	$Y_{Hi}/2 + \epsilon$	$Y_{Lo}/2 - \epsilon$
$Y_{US}$	$Y_{Hi}/2 - \epsilon$	$Y_{Lo}/2 + \epsilon$	$Y_{Lo}/2 + \epsilon$	$Y_{Hi}/2 - \epsilon$

→ For each state, the total world output is unchanged.

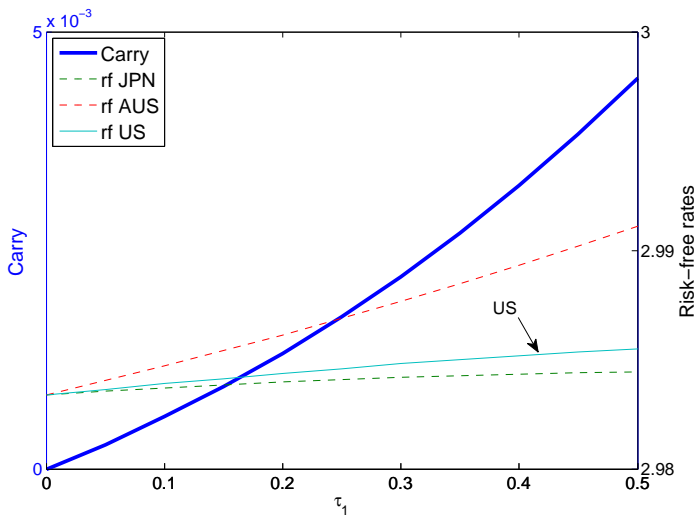

→ Same mean, but Japan has more volatility.

- For simplicity,  $\tau_{0,JPN} = \tau_{0,US} = 0$ .
- Show results for increasing values of  $\tau_{1,JPN} = \tau_{1,US}$ .

# Results: two countries

# Results: **three** countries

# Take-aways

- Returns from carry-trade are robust to introducing a third country

# Take-aways

- Returns from carry-trade are robust to introducing a third country
- Double sorting on commodity exports and number of trading partners?

# Take-aways

- Returns from carry-trade are robust to introducing a third country
- Double sorting on commodity exports **and** number of trading partners?
- Extensions:
  - heterogenous shipping capacity
  - relative country size
  - heterogenous bilateral trade agreements
  - ...

# Concluding Remarks

- There is a lot more in the paper
  - include disaster risk
  - a very well executed empirical analysis

# Concluding Remarks

- There is a lot more in the paper
  - include disaster risk
  - a very well executed empirical analysis
- A great paper:
  - A fresh look at the returns from carry trade
  - Bridge the gap between int'l trade and int'l finance literatures
